The Deaf community - a minority group of 500,000 Americans who communicate using American Sign Language (ASL) - experiences trauma and addiction at rates double to the general population. Although there are validated treatments for this common comorbidity in hearing populations, there are no evidence-based treatments that have been evaluated to treat trauma, addiction, or other behavioral health conditions among Deaf people.

Current evidence-based trauma and addiction treatments developed for hearing populations fail to meet the needs of Deaf clients. One example is Seeking Safety, a well-validated, NIDA-funded therapeutic intervention used to treat people recovering from trauma and addiction. Seeking Safety is a counseling model that addresses a client's trauma and addiction issues without causing retraumatization. It is a safe and effective intervention that includes a therapist guide and client handouts for 25 individual or group sessions, each teaching clients a safe coping skill (e.g., "Asking for Help," "Coping with Triggers"). For additional information about Seeking Safety, please visit www.seekingsafety.org

Attempts to use Seeking Safety with Deaf clients exposed unique barriers that resulted in less effective treatment in this population. One barrier is the use of written English materials instead of materials presented in ASL. Deaf people often have lower English literacy levels than hearing people; therefore, an intervention heavily based on the written word presents a challenge to Deaf clients. Another barrier is the use of treatment materials that are not inclusive of Deaf culture and social norms, nor sensitive to Deaf people's history of oppression by hearing people. For example, most hearing individuals view deafness as an impairment that needs to be fixed. Conversely, most Deaf people do not view themselves as impaired, but as members of a rich culture with shared experience, history, art, and literature.

To address these barriers, researchers at the University of Massachusetts Medical School's Systems and Psychosocial Advances Research Center (SPARC) assembled a team of Deaf and hearing researchers, clinicians, filmmakers, actors, artists, and Deaf people in recovery to develop Signs of Safety – a population-specific client toolkit and therapist companion guide that supplements Seeking Safety. The client toolkit includes visual handouts, which present information using plain text and visual aids created by a Deaf artist. It also contains ASL teaching stories on digital video using Deaf actors, which present key learning points via an educational soap opera. The therapist companion guide offers tips to adapt Seeking Safety for Deaf clients, including vocabulary for ASL translation and helpful tips for working with Deaf clients. It also educates the therapist about how the 25 safe coping skill topics in Seeking Safety interact with Deaf experience and culture.
Signs of Safety is built on recommended principles for creating Deaf-accessible interventions that include:

1. Adaptations for language, including the simplification and avoidance of English-based materials, and the use of visual and pictorial aids;
2. Attention to gaps in health literacy;
3. Reliance upon storytelling and visual metaphors;
4. Teaching concepts through examples;
5. The use of active treatment strategies, like role playing and therapeutic activities, as a basis for generating discussions and insights; and
6. Creative uses of technology.

SPARC researchers are currently leading a pilot study of Signs of Safety, in which participants receive a proven therapy (Seeking Safety) supplemented by the experimental Signs of Safety. Data are being collected on key aspects of feasibility (e.g., attendance, retention, rate of enrollment, fidelity, and assessment procedures); participant satisfaction; and clinical outcomes (e.g., PTSD symptoms, substance use disorder symptoms, and coping efficacy). Preliminary findings show that participants are reporting symptom reduction from baseline to follow-up and high levels of satisfaction with the model. These encouraging results suggest that further exploration of this line of research is warranted. Future research efforts, which include a goal of randomized clinical trials, will be informed by the rich participant feedback received on strategies to further improve Signs of Safety materials for a professional-quality second iteration.

Signs of Safety therapist guide, visual handouts and screenshot of ASL teaching story from Session 2: “Safety”
1. Check-In  
(5 min.)  
Clients report on five questions about how they are doing since the last session.

2. The Quotation  
(2 min.)  
Clients identify the main point of an inspirational quotation.  
The therapist links it to the session topic.

3. Relate the Topic to Clients’ Lives  
(30-40 min.)  
Clients read through the session handouts, or watch the 5-minute ASL Teaching Story.  
The therapist and client then relate the material to current and specific problems in clients’ lives and offer intensive rehearsal of the material.

4. Check Out  
(5 min.)  
Clients answer three questions to reinforce their progress and give the therapist feedback.
