Co-occurring posttraumatic stress disorder (PTSD) and substance use disorder (SUD) is common, affects multiple domains of functioning, and presents complex challenges to recovery. Initial research indicates that individuals with physical disabilities experience higher rates of lifetime trauma and PTSD, and exhibit more severe SUD compared to non-disabled individuals. To expand upon these initial findings, we conducted a series of two studies on PTSD and SUD among individuals with physical disabilities:

ABSTRACT
Using data from the National Comorbidity Study Replication, a national epidemiological study of mental disorders, we identified the prevalence of PTSD and SUD, the symptom presentation of these disorders, and help-seeking behaviors in relation to PTSD and SUD among individuals with physical disabilities. Results indicated that individuals with physical disabilities exhibited higher rates of PTSD, SUD, and comorbid PTSD/SUD, reported more lifetime trauma events, and endorsed more recent, severe PTSD symptoms than non-disabled individuals. No significant pattern of differences was noted for SUD symptom presentation, nor for receipt of lifetime and past-year PTSD and SUD treatment.

STUDY 1

METHOD
• Data from the 2001 – 2003 administration of the National Comorbidity Study Replication (NCS-R), a national epidemiological study of mental disorders
• Variables analyzed: Demographics; DSM-IV PTSD/SUD diagnoses; characteristics of trauma and substance use; help-seeking
• Physical disability status = “Do you have any of the following conditions: Any physical handicap or disability?”
• Weighting/stratification/clustering applied as recommended by NCS-R analysts

SUBJECTS
• 10.1% of the sample had a physical disability, weighted n = 491 (of n = 4,883)
• Subsample of individuals with physical disabilities were:
  • 8 years older
  • Reported a lower yearly income
  • More likely to be divorced/separated/widowed
  • Less likely to have a high school diploma
  • Less likely to be employed
• These disparate variables were entered as covariates in all analyses

SELECTED RESULTS
• Intersecting minority identities had the highest rates (but lowest help-seeking)

CONCLUSIONS
• Initial evidence of PTSD, SUD, and PTSD/SUD disparities among individuals with physical disabilities
• Ongoing epidemiological efforts should:
  • Apply clearer definitions of disability
  • Include more meaningful disability variables
  • Recruit/provide access to individuals with disabilities
• Justifies need to direct prevention and intervention efforts to this population, especially those with intersecting minority identities

STUDY 2

METHOD
• Data from a NIDA Clinical Trials Network study, collected at 7 community-based substance abuse treatment programs
• 6 weeks of group sessions (2/week)
• Collected at baseline and reassessed at 1 week, 3, 6, and 12 months post-treatment
• Variables analyzed:
  • Clinician-Administered PTSD Scale (CAPS)
  • Physical disability status = “Do you receive a pension for a physical disability?”

SUBJECTS
• Nondisabled group:
  • 333 women
  • 164 assigned to SS and 169 assigned to WHE
• Participants with disabilities group:
  • 20 women (5.7% of the total sample)
  • 12 assigned to SS and 8 assigned to WHE
• Reported physical disabilities included orthopedic problems (i.e., back, wrist, ankle, foot), chronic pain, asthma, HIV, and heart conditions

SELECTED RESULTS
• In contrast, nondisabled participants showed decreases in PTSD over time, regardless of enrollment in SS or WHE

CONCLUSIONS
• Our main finding, that participants with disabilities had better outcomes in SS than WHE, speaks to the genuine need to address trauma and PTSD more directly with this group
• The SS model may be particularly relevant for this population by providing a trauma focus without requiring clients to delve into painful trauma memories, and instead offering a present-focused, optimistic focus on coping skills and education

Ongoing epidemiological efforts should:
• Apply clearer definitions of disability
• Include more meaningful disability variables
• Recruit/provide access to individuals with disabilities
• Justifies need to direct prevention and intervention efforts to this population, especially those with intersecting minority identities
