Women’s Decision Making About the Use of Hormonal and Nonprescription Remedies for the Menopausal Transition
Rosemary Theroux, RNC, PhD

**PURPOSE**
- Background and Significance:
  - 30 million women are going through menopause
  - 6 million will experience menopause in the next 10 years
  - By the year 2020 the number of women over age 50 will double

**Practice Issues:**
- Women who have initiated HT will be revisiting their initial decision
- Women evaluated the information given to them about menopause as lacking in quality
- Counseling Services provided to menopausal women in managed care are being evaluated for quality, breadth, and individualization

**Healthcare Services for menopausal women need improvement**

**Context of the Studies:**
Hormone therapy was advocated for women to prevent heart disease and osteoporosis

Results of studies on long-term use (Women’s Health Initiative, WHI) were not completed

**METHOD:**
**INTEGRATIVE REVIEW**
- Literature search
- Databases: Cinahl, Psych Info, 1982-2001
- Keywords: decision making for HT, attitudes to HT, herbal remedies, qualitative research
- Findings compared within and across studies
- Categories developed and merged

**Sample**
- 16 qualitative studies 1996-2001
- Total of 576 participants
- 12 used qualitative methods alone; 1 used both quantitative and qualitative
- 3 used qualitative methods with an instrument

**Data Collection methods**
- Single audiotaped interview 8
- Focus groups 4
- Combination of focus groups & individual interviews 3; written questionnaire 1

**FINDINGS**
Decision making is a non-linear process with stages (Woods et al., 1997)
- Precontemplation
- Commitment
- Contiguance

Women cycled through the stages and revisited prior stages. The process was the same regardless of their decision (HT, nonprescription remedy, lifestyle change)

**Women’s Experiences During Decision making**
- Ambivalent
- Confused
- Frustrated
- Unsure
- Conflicting and incomplete information on HT

**Women’s Experiences with Health Care**
- Lack of information available
- Poor communication with physicians
- Lack of time at visits to discuss concerns
- Concerns not taken seriously
- Experiences with NPs not described

**Influences on the Process**
- Internal:
  - Needs, benefits and risks
  - Attitudes and beliefs
  - Values
  - Context
- External: Interactions With
  - Family, friends, co-workers
  - Cultural group
  - Health care providers
  - Media and information sources

**Desired Role in the Decision Process:**
- Replied on provider to decide
- Decided together with provider
- Replied on self to make decision

**Desired Health care Experience:**
- Communication and open dialog with sharing of information
- Assistance with weighing of benefits and risks

**CONCLUSIONS**
**Implications for Research**
- Since the release of the WHI the context of the decision making has changed.
- Further studies are needed

**Implications for Practice**
- Nurses can meet women’s needs for information by designing accessible and unbiased information about menopause management.
- During counseling clarify the role women want to take in the decision process, and determine their stage in the decision process.
- Elicit women’s perceptions about their needs and goals, values and beliefs, and knowledge about menopause.

Seven investigators found that during the decision making process women weighed the benefits and risks, the advantages and disadvantages, the potential gains against possible harms, or the pros and cons. One usually outweighed the other.
