How do medical students learn about the healthcare impact of essential multiculturalism issues in an increasingly diverse population? This study gauges student participation in a variety of multiculturalism curricula and student assessment of curriculum time devoted to multiculturalism at school versus national levels.

BACKGROUND

How do medical students learn about the healthcare impact of essential multiculturalism issues in an increasingly diverse population? This study gauges student participation in a variety of multiculturalism curricula and student assessment of curriculum time devoted to multiculturalism at school versus national levels.

METHODS

Seven items from the AAMC Graduation Questionnaire (GQ) address specific aspects of multicultural curricula that directly map to various multiculturalism curriculum options at our school. The proportion of students participating in each was compared at school and national levels over the past four years (2003-2006). A bivariate statistical analysis tested a null hypothesis that differences between the two groups equal zero. School and national student ratings of “inadequate” time devoted to “culturally appropriate care” were compared by χ² analysis.

RESULTS

Our students participated significantly more frequently than at other US medical schools (based on GQ national data) in five of seven multiculturalism curriculum experiences: international health, delivering healthcare to underserved populations, learning another language to improve communication, experiences with minority health disparities, and experiences related to cultural awareness across the four years/comparison groups (p < 0.05) (Graph 1). While not statistically significant, this school still surpassed national trends in participation in community health field experiences and working with community-based multicultural groups. Also a significantly lower percentage of our students rated their instruction time devoted to “culturally appropriate care” as “inadequate”: 11.6%/24.1% (2003), 8.1%/20.4% (2004), 5.5%/25.2% (2005), and 2.4%/19.3% (2006) (Table 1).

CONCLUSION

Our school is providing more opportunities than other US medical schools to learn about the culture, language, and health issues of diverse patient populations through a combination of both required and voluntary multiculturalism curricula. These opportunities are helping students develop skills that will help them better serve such populations as evidenced by more than twice as many of our students learning a second language compared to the national average and more of our students actually delivering services to underserved populations, a disproportionate number of whom are recent migrants to the U.S.

Whether this experience directly connects with student satisfaction or awareness will need further investigation.
