What I will tell you

• Alcohol and drug use have health risks
• Substance use disorders are health conditions
  • There is a spectrum of use and consequences and the distinctions matter
• We talk about and address alcohol and drugs differently from other health risks and conditions
  • Those are related...
  • Language contributes to and reflects stigma (and it affects policy and care)
• Consensus is emerging around accurate non-stigmatizing terminology
Relative Risk Of Death Across Different Levels Of Red Meat Consumption

JUST SAY NO

Just say no
What happens to people with diabetes who are incarcerated?

- Insulin is continued

What happens to pregnant women with diabetes?

- They and their babies receive pre- and post-natal care

What happens to pregnant women who drink alcohol or smoke cigarettes?

- They and their babies receive pre- and post-natal care
Alabama’s 2006 Chemical Endangering Law....to prosecute and punish women who give birth to babies with drugs in their systems. (cocaine, opioids, not alcohol, nicotine)
The social stigma attached to addiction is most often portrayed as an attitudinal problem rooted in the lack of knowledge about alcohol, tobacco, and other drug (ATOD) problems and the prevalence and methods through which they are effectively resolved. The resulting antipathy thus becomes focused on public and professional education and changing attitudes through sustained public contact with those who have experienced increased recovery from such problems.

There is, however, another far more penetrating analysis that asked three provocative questions: 1) Who profits from the social stigma attached to ATOD problems? 2) What strategies and tactics are utilized to create, sustain, and intensify ATOD-related social stigma? 3) How could such stigma promoting coercion and control with systems of public complicity, professional care, and peer recovery support?

Choice?

• Selection
  • not all use is a disease, not all substance use disorders are the same

• No one would choose addiction

• Even if first use is a choice, repeated use leads to brain changes that reduce the capacity to stop

• Multifactorial genetic and environmental etiologies

• We treat the consequences of other choices
Alcohol use disorder (DSM 5)
2 or more in 12 mo; 2-3=mild, 4-5=moderate, 6 or more=severe

1. recurrent use resulting in a failure to fulfill major role obligations at work, school, or home
2. recurrent use in situations in which it is physically hazardous
3. continued use despite having persistent or recurrent social or interpersonal problems
4. tolerance
5. withdrawal
6. use in larger amounts or over a longer period than intended
7. persistent desire or unsuccessful efforts to cut down
8. a great deal of time is spent obtaining alcohol, using it, recovering from it
9. important social, occupational, or recreational activities given up or reduced
10. use despite knowledge of related physical or psychological problem
11. craving

Moderate to severe is similar to ICD-10 dependence
UNHEALTHY USE

Terminology for unhealthy use

**Disease**
- Use disorder (DSM)
  - Addiction (ASAM)
- Dependence, harmful (ICD)
  - Like old DSM IV abuse/dependence

**Risk**
- At-risk, risky,
- Hazardous
Stigma

• Stigmatizing terms can affect the perception and behavior of
  • patients,
  • their loved ones,
  • the general public,
  • scientists,
  • and clinicians.

• Can also affect the quality of care and health care policies

“Dependence”

• DSM IV/ICD vs. physical
Medical News & Perspectives

A Day in the Life: NICU Medical Director Tends to Opioid-Addicted Infants

April 27, 2017, 10 AM
A Day in the Life: NICU Medical Director Tends to Infants With Neonatal Abstinence Syndrome
Stigma moderated by two factors...

• Causal attribution
  • **Did they cause it?**
    • “It’s not their fault” (decreases stigma; increases compassion)

• Perceived Control/self-regulation
  • **Can they help it?**
    • “They can’t help it” (decreases stigma; increases compassion)
Two commonly used terms...

• Referring to someone as...

  • “a substance abuser” – implies willful misconduct (it is their fault and they can help it)

  • “having a substance use disorder” – implies a medical malfunction (it’s not their fault and they cannot help it)

But, does it really matter how we refer to people with these (highly stigmatized) conditions? Can’t we just dismiss this as a well-meaning point, but merely “semantics” and “political correctness”? 
Words matter

The words we use to describe drug and alcohol use disorders contribute to stigma around the conditions, psychologist John F. Kelly told attendees at a recent White House Conference on Drug Policy Reform.
Mr. Williams *is a substance abuser* and is attending a treatment program through the court. As part of the program Mr. Williams is required to remain abstinent from alcohol and other drugs. He has been doing extremely well, until one month ago, when he was found to have two positive urine toxicology screens which revealed drug use and a breathalyzer reading which revealed alcohol consumption. Within the past month there was a further urine toxicology screen revealing drug use. Mr. Williams *has been a substance abuser* for the past six years. He now awaits his appointment with the judge to determine his status.

Mr. Williams *has a substance use disorder* and is attending a treatment program through the court. As part of the program Mr. Williams is required to remain abstinent from alcohol and other drugs. He has been doing extremely well, until one month ago, when he was found to have two positive urine toxicology screens which revealed drug use and a breathalyzer reading which revealed alcohol consumption. Within the past month there was a further urine toxicology screen revealing drug use. Mr. Williams has *had a substance use disorder* for the past six years. He now awaits his appointment with the judge to determine his status.
How we talk and write about these conditions and individuals suffering them does matter.

Counselors in the “abuse” condition agreed more with the notion that the person was personally culpable, they were seen as a social threat, treatment was less likely to be recommended, and they thought that punitive measures should be taken.

Methadone Maintenance
Still controversial...

Opioid Abuse in Chronic Pain —
Misconceptions and Mitigation Strategies

Nora D. Vokoun, M.D., and A. Thomas McLellan, Ph.D.

Opioid addiction and abuse are among the most prevalent health issues in the United States, with associated costs estimated at $200 billion annually. The urgent need to address opioid misuse has led to increased interest in developing alternative pain management strategies. This review focuses on the misconceptions regarding opioid use in chronic pain management and the need for evidence-based guidelines to help healthcare providers make informed decisions.

Key Points:
1. Chronic pain is a complex condition affecting millions of Americans, leading to significant disability and healthcare costs.
2. Opioids remain a cornerstone of pain management due to their efficacy in providing pain relief.
3. Misconceptions about opioids, such as concerns over overuse and addiction, hinder effective pain management.
4. Evidence-based guidelines are essential to address opioid-related issues, including misuse and abuse.
5. Healthcare providers need ongoing education and support to improve the treatment of chronic pain while minimizing opioid-related risks.

This is substance abuse
ADDITION TERMINOLOGY STATEMENT

The International Society of Addiction Journal Editors recommends against the use of terminology that can stigmatize people who use alcohol, drugs, other addictive substances or who have an addictive behavior.

Rationale: Terms that stigmatize can affect the perception and behavior of patients/clients, their loved ones, the general public, scientists, and clinicians (Broyles et al., 2014; Kelly, Dow & Westerhoff, 2010; Kelly, Wakeman & Saitz, 2015). For example, Kelly and Westerhoff (2010) found that the terms used to refer to individuals with substance-related conditions affected clinician perceptions. Clinicians who read a clinical vignette about “abuse” and an “abuser” agreed more with notions of personal culpability and an approach that involved punishment than did those who read an identical vignette that replaced “abuse” and “abuser” with “substance use disorder” and “person with a substance use disorder.”

ISAJE is aware that terminology in the addiction field varies across cultures and countries and over time. It is thus not possible to give globally relevant recommendations about the use or non-use of specific terms. “Abuse” and “abuser” or equivalent words in other languages should, however, in general be avoided, unless there is particular scientific justification (an example of scientific justification of the use of “abuse” is when referring to a person who meets criteria for a Diagnostic and Statistical Manual of Mental Disorders, Fourth Edition, alcohol abuse; that person would be said to have “alcohol abuse”). Another example of stigmatizing language is describing people as “dirty” (or “clean”) because of a urinalysis that finds the presence (or absence) of a drug (Kelly, Wakeman & Saitz, 2015). Instead, the test results and clinical condition should be described.

The above was approved by the International Society of Addiction Journal Editors at its 2015 annual meeting (Budapest, Hungary, August 31-September 2, 2015).
Stop talking dirty

• Avoid “dirty,” “clean,” “abuser”
  • Negative urine test for drugs

Treatment terms: misperceptions

• Avoid “medication-assisted,” “substitution”
  • Treatment, opioid agonist treatment

Samet JH, Fiellin DA. Opioid substitution therapy—time to replace the term
The Lancet, Volume 385, Issue 9977, 1508 - 1509
Thanks to Tom McLellan for the concept

Journal of Addiction Medicine

• Humanizing
• Non-stigmatizing
• Medical, scientific terms
• Precise
• Professional consensus-driven

http://journals.lww.com/journaladdictionmedicine/Pages/informationforauthors.aspx#languageandterminologyguidance
• Person-first language
  • Not addict, alcoholic, drunk but person with...
• Avoid “abuse,” “abuser”
  • usually “use” is more accurate (unless referring to DSM dx)
• The disease: substance use disorder (DSM), addiction, other diagnostic terms (ICD dependence, harmful)
• Drug versus medication
• Generally avoid misuse (when disorder is meant; except for prescription?), problem, binge, inappropriate, moderate
  • Use low risk, at risk, risky, hazardous, unhealthy (spectrum)

Disease does not remove responsibility

Disease does not mean behavior can be objectionable
Reasons why this is difficult

• Inertia, language device, brevity, convenience, perceived cumbersome alternatives, even among experts and leaders

• Agency names: NIDA, SAMHSA, single-state agencies for substance abuse services, journal names “Substance Abuse,” society names

• BUT none of that would be an excuse were it cancer, heart disease...

Editor’s Note

Distinguishing Between Substance Use and Substance Use Disorder

McNeely and Saitz¹ are correct that the field of drug use and screening would benefit from clarity in terminology. However, in practice, it can be very challenging to distinguish between substance use and a substance use disorder.

Howard K. Koh, MD, MPH
Harvard T.H. Chan School of Public Health, Boston, Massachusetts; and Harvard Kennedy School, Cambridge, Massachusetts.

Words matter. In the scientific arena, the routine vocabulary of health care professionals and researchers frames illness and shapes medical judgments. When these terms then enter the public arena, they convey social norms and attitudes. As part of their professional duty, clinicians strive to use language that accurately reflects science, promotes evidence-based treatment, and demonstrates respect for patients.

However, history has also demonstrated how language can cloud understanding and perpetuate societal bias. For example, in the past, people with mental illness were derided as “lunatics” and segregated to “insane asylums.” In the early days of human immuno-

Stigma isolates people, coming forward for treatment, knowingly or unknowingly, seeking evidence-based treatment. Survey on Drug Use and Health: 22.5 million people (aged 12 or older) self-reported treatment for a problem drug use, only an estimated 1.6 million received treatment for substance use disorder in the past year; of those, needing specialty treatment receiving it would adversely

Comment & Response

Substance Use Terminology

To the Editor: We share the concerns of the authors of a Viewpoint about the prevalent use of stigmatizing language to refer to unhealthy substance use and the people affected by it. Movements at the national level are occurring to encourage the use of nonstigmatizing language, such as the addiction terminology statement by the International Society of Addiction Journal Editors, which marks an important step in developing a consensus on stigmatizing language among medical journals worldwide. In particular, it discourages the use of “dirty,” “clean,” “abuse,” and “abuser.”

The authors discussed the draft document about addiction language from the Office of National Drug Control Policy. We wish to point out that it includes misuse and medication-assisted treatment as preferred terms. Certainly “misuse” could apply to a medication that has an intended use, but it could be stigmatizing when used to refer to a disorder (as per its current use by the Department of Veterans Affairs for alcohol, for which the disorder comes under “severe” misuse). However, life-saving opioid agonist treatments should not be relegated to “assistance” status. They are medication treatments just as insulin is for diabetes (which also has behavioral treatments), not therapies that merely “assist” some other treatment. In fact, it has been difficult to detect the effects of psychosocial care above those of opioid agonists in clinical trials. This term may help explain in part the limited use of and stigma surrounding the treatment.
