The Perioperative Surgical Home (PSH): A New Paradigm in a Surgical Episode of Care

INTRODUCTION

A Perioperative Surgical Home (PSH) is a patient-centered, physician-led, multidisciplinary, and team-based system of coordinated care for surgical patients. The PSH coordinates care and transitions from the decision to operate through the intra-operative course and return to primary care, using the anesthesiologist to coordinate care. The PSH model has been developed using the guiding principles of the PCMH, which focuses on coordinated care in the primary care setting.

OBJECTIVES

1. Enhance value and help achieve the triple aim of better patient experience, better health care, and lower costs.
2. Provide consistent care across the continuum.

METHODS

Target population: Patients undergoing anatomic cancer surgery.

Collaboration between Departments of Urology and Anesthesiology

January 2015–June 2016

Quality improvement effort, focusing on each stage of the perioperative process: Pre-operative, intra-operative, post-operative, and post-discharge.

Process improvements to standardize care, make care more person-centered, improve communication across surgical episode stages and with primary care.

Process and outcome measures, including complications, patient experience, costs, etc.

Data collection from patient records and phone calls to patients.

PILOT PROGRAM

For the PSH to work, my preferences and those of my family were taken into account in deciding what my health care needs would be when I left the hospital.

When I left the hospital, I clearly understood the purpose for taking each of my medications.

When I left the hospital, I had a good understanding of the things I needed to do in order to improve my health.

The hospital staff took my preferences and those of my family into account in deciding what my health care needs would be when I left the hospital.

Length of stay: June 2015–March 2016

• Nephrectomy: Length of stay in pilot = 2.76 days; not in pilot = 6.4 days

• Prostatectomy: Length of stay in pilot = 1.38 days; not in pilot = 4.83 days

LIMITATIONS

• Pilot period is not complete

• Lack of pre- to post-comparison

• Actual cost data pending

• Need appropriate benchmarks for care

• Small numbers – QI study

CONCLUSIONS

We have demonstrated that our PSH pilot is moving toward improved efficiencies, decreased waste, improved patient and physician satisfaction, and decreased cost of care.

Collaboration and team work is paramount to starting and undertaking a QI project such as the implementation of a PSH.

It is important to identify personnel who are engaged, motivated, enthusiastic, and reliable.

It is a dynamic process and at every step there is always more than can be done to improve the care of our patients, eliminate waste, and decrease costs.

FUTURE STUDIES

Continuation of pilot will result in more robust process and outcome data.

Possible expansion to more anatomic surgical procedures and other disciplines.

PCP Survey

Integrating with ACO development

Solidifying new processes to be the standard of care
