Background
The demographics of the United States are shifting, causing service systems to face an ever-increasing need to accommodate a broader array of cultural and linguistic backgrounds. Progress is needed to ensure systems are prepared to competently serve current and future populations.

The project team conducted a state needs assessment of children and youth with Autism Spectrum Disorder (ASD) and Developmental Disabilities (DD) that aligns with the six MCHB Healthy People 2020 core indicators (i.e., early identification, medical home, access to community-based systems of care, family involvement, transition to adulthood, and insurance). The results will inform state efforts to establish a state-level data collection and surveillance plan for systems of services for children and youth with ASD and DD.

Preliminary data from the needs assessment across multiple sources indicate that screening and evaluation for ASD and other DD’s in Massachusetts occur less frequently in non-native English-speaking populations and other minority cultures, demonstrating a need for systemic improvement.

Methods
- Six, 90-minute focus groups with culturally and linguistically diverse participants held across the state to better understand the effects race, culture & language have on the six core indicators.
- Parents of children or youth with ASD and/or DD were recruited through existing, community networks and paid a small stipend for their time.
- Focus groups were led by an experienced facilitator, an assistant facilitator and a note-taker.
- Questions were translated & shared in advance.
- Training to promote cultural competence in the medical home.
- Recruitment of trained bi-cultural and bi-lingual professionals from the community, we need all our ABA service providers are wonderful but we aren’t able to communicate with them. We have no access to them because they’re monolingual and they don’t speak Chinese. We would benefit so much more and get so much more from ABA if we could communicate with them.

Participants Groups
Massachusetts Demographics:
- Number of residents: 6.5 million; 367,087 children under 5
- Child population by race: Non-Hispanic White, 66%; Non-Hispanic Black 8%, Hispanic, 16%; Asian, 6%
- Children in immigrant families: 27%
- Predominant languages: Cambodian, Chinese, Haitian-Creole, Portuguese, Somali, Spanish, Vietnamese and many more

Focus Groups: Vietnamese, African-American, Haitian, Hispanic, Chinese

Across Culture Results

Discussion
Culturally and linguistically competent information, resources, and services are essential to help families of children with ASD move beyond common obstacles to meeting their needs. At present, state service and support systems may not be fully structured to accommodate diverse needs.

Among our preliminary recommendations:
- A one stop, multilingual online information & referral source for families and professionals that explains systems & processes, such as the state information & referral site INDEX.
- IEPs and related communications must adhere to federal law.
- Not only do we need trained professionals in the community, we need all types of language access that are carried out with people who have proficiency in the culture as well as the language. Proficiency is the key.
- The school is supposed to send home the documents interpreted. They ignore us or they translate it with Google Translate and it’s not understandable.
- Our ABA service providers are wonderful but we aren’t able to communicate with them. We have no access to them because they’re monolingual and they don’t speak Chinese. We would benefit so much more and get so much more from ABA if we could communicate with them.

After my child was diagnosed, the doctor printed out some Google stuff for me and asked, “Can you access Google stuff at home? How much English do you understand?”

The results will be used to call attention to cultural & linguistic disparities in our final report recommendations for refinements to the existing Massachusetts Autism Commission plan by end of Summer 2016.

This project was funded by HRSA-MCHB as part of a State Autism Planning Grant.
