Physician-Delivered Weight Management Counseling (PD-WMC)

Authors
Jennifer Lee, Linda C. Churchill, Effie Olendzki, and Judith K. Ockene

Keywords
obesity, weight loss, weight management counseling, Body Mass Index (BMI)

Comments
Jennifer Lee participated in this study as a medical student as part of the Senior Scholars research program at the University of Massachusetts Medical School. This poster was presented on Senior Scholars Program Poster Presentation Day at the University of Massachusetts Medical School, Worcester, MA, on April 27, 2016.

Objective and Rationale

Objective: Gather information about and describe specific PD-WMC strategies, stratified by gender and BMI, currently provided to adults with BMIs ≥25.0, patients’ reported benefits of these WMC approaches, and their WMC preferences for future care.

Background and Rationale: Excess Weight Leads to Poor Health Outcomes

• Over 2/3 of adults in America are overweight or obese
• Adults with excess weight have increased morbidity and mortality compared to those of normal weight

Physician-Delivered Weight Management Counseling on Health Outcomes

• When counseled by physicians, patients become motivated to lose weight, improve their diet, and increase their physical activity, reducing weight-associated health risks
• PD-WMC occurs infrequently

An Approach to Weight Management Counseling

• A better understanding of what physicians are currently providing for WMC and of what patients want can lead to improved WMC treatment algorithms, allowing for more effective and frequent PD-WMC

Design and Methods

Design: Cross-sectional study comparing patients’ WMC experiences and preferences, stratified by BMI and gender

Participants: Inclusion criteria:
1) Men or non-pregnant women
2) 18-75 years of age
3) Had primary care physician visit within past six months
4) Has BMI ≥25.0
5) Can read, speak, and write in English

Exclusion criteria:
1) Adults unable to consent
2) Adults unable to read, speak, or write in English
3) Prisoners
4) Pregnant or breastfeeding women

Recruitment Methods:
• Intranet recruitment advertisements
• Volunteer registry through UMass Center for Clinical and Translational Science
• Paper flyers distributed around the community
• Local primary care practice

Materials and Analysis

Patient Survey

Sample questions

- Physical Activity
  - My PCP has discussed the role of physical activity
    - Yes (Agree)
    - No (Disagree)

- Dietary and lifestyle changes
  - I would like my PCP to talk more about the role of physical activity in weight loss.

Statistical Analysis

• Frequency counts were used in analysis of all questions
• Chi-square and Fisher’s exact test (p<0.05) were performed to assess significance between stratiﬁed groups
• Descriptive statistics and frequencies were used to describe demographics

Results

Study Sample

Gender: Female, Male
Age: 18-34, 35-64, 65-75
Race: White, Other
BMI: Men: 25.0, ≥25.0
Women: 25.0, ≥25.0

Key findings (non-stratiﬁed)

- Frequency of weight-management discussions with PCPs: 35% reported having these discussions during most or all of their visits, though 51% wanted to discuss their weight with their PCPs during most visits
- WMC preferences for future weight management counseling: Generation of specific strategies to assist in weight loss (74.8% agreed with the statement, “I would like my PCP to begin or continue offering me specific strategies to lose weight?”) + Development of speciﬁc weight loss goals (65.1% agreed with the statement, “I would like my PCP to work with me to develop more speciﬁc weight loss goals.”)

Key findings (stratiﬁed by gender)

- Men:
  - Techniques with most reported beneﬁt (n=4)
  - WMC preferences for future weight management counseling
  - Overweight participants: Techniques with most reported beneﬁt (n=4)
    - WMC preferences for future weight management counseling

- Women:
  - Techniques with most reported beneﬁt (n=4)
  - WMC preferences for future weight management counseling

Discussion

- The fact that participants with BMIs≥25 reported an increased rate of counseling compared to the reported rate by participants with BMIs<25 is not surprising, as screening and WMC guidelines are often focused on the obese population

- Looking at gender, it is unknown whether women objectively receive less WMC than men do or if they report less due to higher expectations about the quality and quantity of PD-WMC they desire

Conclusions/Future plans

- Regardless of BMI and gender, patients desire more WMC, including the development of speciﬁc weight loss goals and the generation of speciﬁc weight loss goals
- Majority of participants reported that scheduling follow-up appointments and having subsequent weight discussions at those appointments were beneﬁcial
- Data from this study were used in the development of a curriculum to educate medical students on how to provide more effective WMC as well as aid in the development of a patient-centered and well-deﬁned clinical framework to improve PD-WMC
- Future studies should explore this topic further with a larger and more diverse participant population

Acknowledgements

We want to thank Dr. Judith Ockene for funding this project and Pina Altomari and Missy Lucier for coordinating various aspects of this study
