**Objective and Rationale**

**Objective:** Gather information about and describe specific PD-WMC strategies, stratified by gender and BMI, currently provided to adults with BMIs ≥25.0, patients’ reported benefit of these WMC approaches, and their WMC preferences for future care.

**Background and Rationale:**
Excess Weight Leads to Poor Health Outcomes
- Over 2/3 of adults in America are overweight or obese
- Adults with excess weight have increased morbidity and mortality compared to those of normal weight

Physician-Delivered Weight Management Counseling on Health Outcomes
- When counseled by physicians, patients become motivated to lose weight, improve their diet, and increase their physical activity, reducing weight-associated health risks
- PD-WMC occurs infrequently

An Approach to Weight Management Counseling
- A better understanding of what physicians are currently providing for WMC and of what patients want to lead to improved WMC treatment algorithms, allowing for more effective and frequent PD-WMC

**Design and Methods**

**Design:** Cross-sectional study comparing patients' WMC experiences and preferences, stratified by BMI and gender

**Participants:**
- Inclusion criteria:
  1) Men or non-pregnant women
  2) 18-75 years of age
  3) Had primary care physician visit within past six months
  4) Has BMI≥25.0
  5) Can read, speak, and write in English

- Exclusion criteria:
  1) Adults unable to consent
  2) Adults unable to read, speak, or write in English
  3) Prisoners
  4) Pregnant or breastfeeding women

**Recruitment Methods:**
- Intranet recruitment advertisements
- Volunteer registry through UMass Center for Clinical and Translational Science
- Paper flyers distributed around the community
- Local primary care practice

**Materials and Analysis**

**Patient Survey**

**Sample questions**

- **Physical Activity**
  - My PCP has discussed the role of physical activity.
  - Changes in physical activity have been beneficial in helping me lose weight or better manage weight.
  - I would like my PCP to talk more about the role of physical activity in weight loss.

- **Survey items** focused on patients' weight loss attitudes, experiences with and preferences for WMC, and demographic information
- **Answer choices** were formatted as yes or no, Likert scale, free text, or rank method

**Statistical Analysis**

- Frequency counts were used in analysis of all questions
- Chi-square and Fisher’s exact test (p<0.05) were performed to assess significance between stratified groups
- Descriptive statistics and frequencies were used to describe demographics

**Results**

**Study Sample**

- **Key findings (non-stratified)**
  - Only 35% reported having these discussions during most or all of their visits, though 51% wanted to discuss their weight with their PCPs during most visits
  - More WMC preferences for future weight management counseling
  - Generation of specific strategies to assist in weight loss (74.8% agreed with the statement, "I would like my PCP to begin or continue offering me specific strategies to lose weight")
  - Development of specific weight loss goals (65.1% agreed with the statement, "I would like my PCP to work with me to develop more specific weight loss goals")

**Key findings (stratified by BMI)**

- Patients with BMIs25 reported higher rates of counseling than participants with BMIs≥30 and ≥25, with significant differences in areas such as discussion about surgery for weight management (p=0.008)

**Discussion**

- The fact that participants with BMIs≥30 reported an increased rate of counseling compared to the reported rate by participants with BMIs≥30 and ≥25 is not surprising, as screening and WMC guidelines are often focused on the obese population
- Looking at gender, it is unknown whether women objectively receive less WMC than men do or if they report less due to higher expectations about the quality and quantity of PD-WMC they desire

**Conclusions/Future plans**

- Regardless of BMI and gender, patients desire more WMC, including the development of specific weight loss goals and the generation of specific weight loss goals
- Majority of participants reported that scheduling follow-up appointments and having subsequent weight discussions at those appointments were beneficial
- Data from this study were used in the development of a curriculum to educate medical students on how to provide more effective WMC as well as aid in the development of a patient-centered and well-defined clinical framework to improve PD-WMC
- Future studies should explore this topic further with a larger and more diverse participant population
