ABSTRACT

BACKGROUND

Autism involves early brain overgrowth and dysfunction, which is most strongly evident in the prefrontal cortex. As assessed on pathological analysis, an excess of neurons in the prefrontal cortex among children with autism signals a disturbance in prenatal development and may be concomitant with abnormal cell type and

Vaccines
Putting shots in the locker

How to anticipate epidemics
Sep 3rd 2016 | From the print edition

FOREWARNED, the proverb has it, is forearmed. But what happens when there is no warning? That was the case in December 2013, when an outbreak of Ebola haemorrhagic fever began in Guinea. It spread rapidly to Liberia and Sierra Leone and raged on for over a year. Around 20,000 people were infected. More than 11,000 of them died.

The world responded to this crisis, shipping in doctors, nurses and medical equipment. But what it could not ship in, for none existed, was the thing that would most quickly have stopped the epidemic: a vaccine. Such a vaccine was created eventually, but by the time it was ready, the outbreak was all but over. Had it been available from the beginning, things could have been different.

Next time, though, they might be, for on August 31st a new organisation came into being. CEPI, the Coalition for Epidemic Preparedness Innovations, was founded this week in London, at the headquarters of the Wellcome Trust, a medical charity. It is the joint brainchild of the Wellcome, the Bill and Melinda Gates Foundation, the World Economic Forum and the government of Norway, and its purpose is precisely to forewarn the world against future outbreaks of disease, without foreknowledge of what those outbreaks will be.

Paradoxically, part of the inspiration for CEPI’s creation was not the failure to deliver an Ebola vaccine in time for it to be useful, but how close that project came to success. Creating a new vaccine from scratch is a long-winded undertaking, but in the case of Ebola several candidate vaccines were already on the shelf thanks to earlier, but stalled, work by America’s army and that country’s National Institutes of Health. There were also three pharma companies, GlaxoSmithKline, Johnson & Johnson and Merck, willing, pro bono publico, to take these candidates and try to turn them into the real thing as quickly as possible. That they succeeded in doing so by the summer of 2015 was, by most standards, extraordinary...

Keywords: Schistosomiasis, Schistosoma mansoni, neglected tropical diseases, vaccine, Schiz-TSP, Phase I, phase II, recombinant protein

A novel recombinant protein vaccine for human schistosomiasis caused by Schistosoma mansoni is under development. The Schiz-TSP-2 protein vaccine is comprised of a 270 kDa recombinant protein corresponding to the extracellular domain of European S. mansoni tetraspanin. Here, we describe the cloning and expression of the external loop of Schiz-TSP-2 recombinant protein we tested by Phase I/II development at 20 L scale fermentation, and the technology of purification, which resulted in a protein recovery yield of 2% and a purity of 97%. The developed processes are suitable for the production of purified protein for subsequent formulation and Phase 1 clinical studies.

Introduction

Schistosomiasis is a pervasive infestation caused by blood flukes of the genus Schistosoma. Today, human schistosomiasis is considered one of the most important human helminthic infections in terms of incidence and morbidity, especially in Africa, where more than 60% of the cases occur. Recent studies indicate that approximately 200 million people are infected worldwide, with 800 million people at risk. However, additional studies indicate that this number may be an underestimate and as many as 100-600 million people may be infected with schistosomes.

Although schistosomiasis is a waterborne infection, the current treatment of choice does not provide an effective strategy for controlling the disease. Since 1990, praziquantel (PZQ) based mass chemotherapy has been the major approach to controlling schistosomiasis, primarily targeting school-aged children with annual treatments. However, the sustainability of PZQ treatment for the long-term control and elimination of schistosomiasis remains a concern and has limitations. For instance, PZQ does not prevent re-infection nor does it induce immunity to resistance to PZQ. Although there is no clear evidence for the existence of PZQ-resistant schistosome strains, increased susceptibility to the drug has been observed in recent outbreaks. To overcome these challenges, a prophylactic vaccine or a vaccine-based chemotherapy would be ideal to complement the existing treatment strategies. Evidence for the feasibility of developing a schistosomiasis vaccine includes studies showing that immunization with irradiated schistosoma cercariae regulates high levels of protection in experimental animal models, with boosts further increasing the level of protection. In addition, a subset of human populations living in endemic areas has been shown to develop various degrees of natural resistance, while serological reactivity vaccines against other plasmodium parasites have been developed successfully and applied in practice.

Extended information on the mechanisms of immunity in schistosomiasis and the recent availability of the schistosome genome for both S. mansoni and S. japonicum have resulted in the discovery of several schistosome antigens, while additional candidates are now being found through genomic approaches. Within the last year results of a Phase 1 trial for a subunit vaccine in the cause of untreated...
The Rise of Emerging + Neglected Diseases in the “New Texas”

- Leading TX NTDs

  - WNV  183-1,900
  - Intestinal protozoan  1,000
  - Cysticercosis  195-754
  - Murine Typhus  >100
  - Dengue, Zika, Chik
The role of trypanocidal therapy in patients with established Chagas’ cardiomyopathy is unproven.

Trypanocidal therapy with benznidazole in patients with established Chagas’ cardiomyopathy significantly reduced serum parasite detection but did not significantly reduce cardiac clinical deterioration through 5 years of follow-up.
Tc24 protein combined with E6020 in a Stable Squalene Emulsion as a lead candidate vaccine

**Candidate Antigen**

Tc24- 24kDa *Trypanosoma Cruzi* Flagellar Calcium Binding Protein

**Candidate Adjuvant**

TLR4 agonist:

E6020

Additional antigens also under evaluation and development
ADVANCES IN A THERAPEUTIC CHAGAS VACCINE INITIATIVE

• Preclinical Efficacy:
  - Pilot studies were performed to evaluate efficacy of recombinant Tc24 combined with imiquimod or MPLA when used as a preventative vaccine

• Preliminary Results
  • Reduce parasitemia
  • Increase survival during acute phase
  • Antigen specific IgG2a
  • Antigen specific IFNγ
  • Reduced cardiac parasite burden
Oligomer Formation: Solving the problem?

Western Blot comparison of Tc24-WT (A), Tc24-C2 (B), and Tc24-C4 (C) purified proteins. Lanes 1-3: Non-Reduced. Lane 4: SeeBlue Plus Molecular Weight Marker. Lanes 5-7 Reduced. Lanes 1,5: Sample before size-exclusion chromatography (SEC) 8 µg load. Lanes 2,6: Post SEC low load (3 µg). Lanes 3,7: Post SEC high load (8 µg). Detection was performed using mouse polyclonal antibody against Tc24 expressed in *Pichia pastoris* as primary antibody diluted 1:2,500 in PBST and an alkaline phosphatase conjugated goat anti-mouse secondary antibody diluted 1:7,500 in PBST.
Maintaining secondary/tertiary structures

**Structural comparison of Tc24 constructs.** a) Circular Dichroism (CD). Far UV CD spectrum of different constructs of Tc24 were taken on a Jasco J-1500. All tested Tc24 protein have a virtual identical CD profile with overlapping spectra. Negative peaks at 222 nm and 208 nm and a positive peak at 193 nm indicate that Tc24 is an α-helical protein. b) Thermal melting profile of Tc24-WT and Tc24-C4 measured using Protein Thermal Shift™ kit (Life Technologies).
The title slide includes graphs and images illustrating the effects of a therapeutic Chagas disease vaccine. It highlights improvements in cardiac function as measured by echocardiography, with a focus on increased IFN-γ and decreased T. cruzi burden and cardiac fibrosis. The conclusion states that the experimental Chagas disease vaccine improves cardiac echocardiography function.
